

EventDemo

```
import java.awt.*;
import java.awt.event.*;

public class EventDemo extends Frame implements ActionListener, ItemListener {

    private Label message;
    private Button button;
    private Checkbox checkbox;

    public EventDemo() {
        // Create components
        button = new Button("Click Me");
        checkbox = new Checkbox("Enable Option");
        message = new Label("Perform an action...");

        // Register listeners
        button.addActionListener(this);
        checkbox.addItemListener(this);

        // Set layout
        setLayout(new FlowLayout());

        // Add components
        add(button);
        add(checkbox);
        add(message);

        // Frame settings
        setTitle("Delegation Event Model Demo");
        setSize(400, 150);
        setVisible(true);

        // Handle window closing
        addWindowListener(new WindowAdapter() {
            public void windowClosing(WindowEvent e) {
                dispose();
            }
        });
    }

    // Handles ActionEvent
    @Override
    public void actionPerformed(ActionEvent e) {
        message.setText("Button clicked - ActionEvent handled!");
    }

    // Handles ItemEvent
    @Override
    public void itemStateChanged(ItemEvent e) {
        if (checkbox.getState()) {
            message.setText("Checkbox selected - ItemEvent handled!");
        } else {

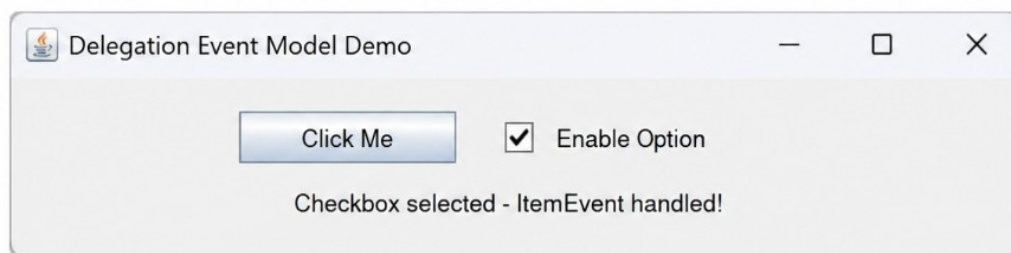

```

```
        message.setText("Checkbox deselected - ItemEvent handled!");  
    }  
}  
  
public static void main(String[] args) {  
    new EventDemo();  
}  
}
```

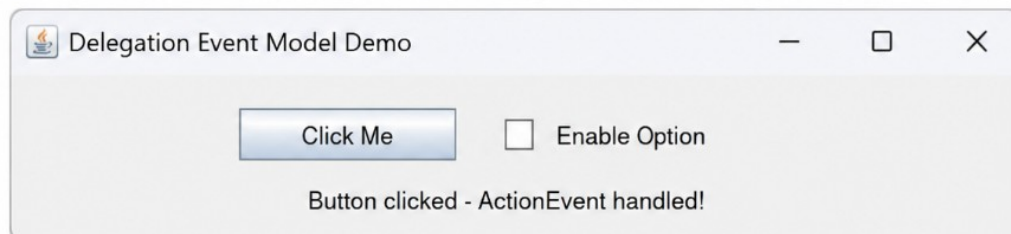

OUTPUT:

1. Initial UI (Before any interaction)

2. After selecting the checkbox (ItemEvent)

3. After clicking the button (ActionEvent)
