

SquareApplet

```
import java.applet.Applet;
import java.awt.*;
import java.awt.event.*;

public class SquareApplet extends Applet implements ActionListener {

    TextField input;
    Button button;
    Label result;

    public void init() {
        // Create AWT controls
        Label prompt = new Label("Enter a number:");
        input = new TextField(10);
        button = new Button("Find Square");
        result = new Label("Square: ");

        // Add controls to the applet
        add(prompt);
        add(input);
        add(button);
        add(result);

        // Register event listener
        button.addActionListener(this);
    }

    // Handle button-click event
    public void actionPerformed(ActionEvent e) {
        try {
            double number = Double.parseDouble(input.getText());
            double square = number * number;

            result.setText("Square: " + square);
        } catch (NumberFormatException ex) {
            result.setText("Please enter a valid number.");
        }
    }
}
```
